

RT 100 T

**Solid carbide spiral-flute
deep hole drills**

**Edition
2013**

EXCLUSIVELINE®

Made by Guhring

Available ex-stock now: The spiral-flute deep hole drill RT 100 T. The program includes standard drills for drilling depths up to 15 x D, 20 x D, 25 x D, 30 x D and 40 x D. The RT 100 T ex-stock range offers an outstanding cost-performance-ratio as well as availability. Moreover, the RT 100 T drills permit highest cutting and feed rates and subsequently achieve a considerable reduction in machining time.

These advantages are achieved thanks to the following attributes:

Optimised flute geometry

The spiral-flute deep hole drills possess a special flute geometry that is optimised to the specific demand for optimal chip evacuation from the deep hole. (fig. 1)

Maximised coolant duct profile

To provide the cutting edge with an optimum coolant supply, the tools possess a maximised coolant duct profile. It ensures an efficient coolant supply to the cutting edge as well as excellent chip evacuation. (fig. 2)

Problem-free swarf

The factors described above – in combination with the cutting parameters optimally adapted to the application task – result in chips that are evacuated problem-free even from deep holes. Chip congestion and a subsequent jamming of the tool is effectively prevented. (fig. 3)

Wear resistant cutting edges

Thanks to the TiAlN-tip coating the cutting edges, that are exposed to maximum forces, are protected against wear.

Ultimate cost-efficiency:

Applied on machining centres, where the drilling operation is a time relevant criterion, RT 100 T can display its superiority. Its high feed rates lead to a shorter production time, its long tool life reduces the number of tool changes.

Fig. 1: Optimised flute geometry for optimal chip evacuation.

Fig. 2: Maximised coolant duct profile for effective cooling/lubrication.

Fig. 3: Problem-free chips preventing chip congestion and jamming of the tool.

RT 100 T – ex-stock range

Reinforced shank for high precision clamping

Drills from the RT 100 T ex-stock range have a reinforced shank to DIN 6535 HA, tolerance h6. This enables the powerful clamping of the tools with hydraulic expansion chucks (fig. 4) from the Guhring GM 300 range. The combination RT 100 T plus hydraulic expansion chuck guarantees highest concentricity, extreme clamping forces, minimal imbalance and optimal efficiency.

Intermediate diameters

In addition to the ex-stock range Guhring still offers RT 100 T drills as special tools to specific customer requirements. We realise intermediate diameters with maximum drilling depths up to $40 \times D$ or a total length up to max. 400 mm. Please use the request form on page 18!

The modification of the shank to the MQL shank end makes the ex-stock range suitable for MQL machining, see page 16.

Deep hole drilling? No problem!

The machining industry talks about deep hole drilling from a depth of $10 \times D$ and above, shorter holes can also be produced with deep hole drills. Therefore, only a few special conditions must be applied:

High-pressure cooling - now a matter of course

As in recent years internal cooling has prevailed with drilling tools, today every conventional machine tool is offered with high-pressure internal cooling and is therefore also suitable for deep hole drilling.

Tool guidance - a must

All deep hole drills must be guided during initial drilling. Deep hole drills must never operate at full speed unsupported.

RT 100 T - on deep hole drilling machines

After checking the clamping and the total length, the application of RT 100 T is possible on deep hole drilling machines with a guide bush.

Procedure

To achieve optimal machining results in the production of deep holes with the RT 100 T particularly when piloting on radii and/or uneven surface we recommend the following machining steps:

1. Milling of flat. The flat must be at right angles to the entry of the drilling operation.
2. Producing a cylindrical pilot hole (tolerance F9) with a minimum drilling depth of $1 \times D$.
3. Entering the RT 100 T slowly into the pilot hole.
4. Setting the cooling lubricant pressure and speed.
5. Continuous drilling to full drilling depth without pecking cycle.
6. For through holes with oblique exit reduce feed rate.
7. Upon reaching the drilling depth switch off speed and cooling lubricant, withdraw with rapid feed rate.

Detailed recommendations regarding the procedure on page 14.

RT 100 T – re-grinding and re-coating

Even the most wear-resistant tools will wear when subjected to rigorous use. Through professional re-grinding to original geometries and re-coating with original coatings Guhring re-produces the original performance so that the tools continue to optimally fulfil all quality parameters. At the same time the refurbishment extends the longevity of tooling which means reduced consumption of new tools hence lower costs.

Our service centres

Fast service requires localised centres and this support is provided through 39 service centres world-wide. More will follow. All service centres are equipped with the latest production machines and Guhring developed coating plants. Every service centre provides a collection and delivery service to offer you our proven process for handling your orders in a flexible, fast and economical manner.

	Re-grinding*	Tip-coating up to 20 x D up to 40 x D		De-coating **
d1	Basic price per piece in €	Additional charge to the basic price in €		Additional charge to the basic price in €
mm				
up to Ø 6 mm	•	•	•	•
Ø > 6 - 8 mm	•	•	•	•
Ø > 8 - 10 mm	•	•	•	•
Ø > 10 - 12 mm	•	•	•	•
Ø > 12 - 14 mm	•	•	•	•

* axial removal max. 1 mm, the diameter is reduced according to the back taper value.
Please specify minimum length and Ø-tolerances when placing order.

** it should be noted that continual re-coating of a tool without prior de-coating results in a diameter increase in the µm-range. Additional coatings are available on request.

RT 100 T – machining steps

Procedure

In order to achieve optimal machining results when producing deep holes with type RT 100 T especially spotting on radii or on an uneven surface structure, we recommend the following machining steps:

1. Initial milling of surface, i.e. with Guhring's centre cutting Ratio end mill RF 100 U. The surface must be machined at right angles to the entry angle of the drilling operation.
2. Production of a cylindrical pilot hole (tolerance F9) with a minimum drilling depth of 1 x D. For this operation we recommend our Ratio drills RT 100 U or RT 100 F respectively. Thanks to a 140° point angle and a m7 tolerance on diameter these Ratio drills are especially suitable for this machining task.
3. Entry of spiral-flute deep hole drill RT 100 T in the pilot hole at a speed of approx. 300 rev./min and with a feed rate of approx. 500 mm/min.
4. Setting of coolant pressure and speed.
5. Continuous drilling to complete hole depth without wood pecking.
6. For through holes with plain - i.e. 90° - exit, reduce feed rate v_f to 50 % approx. 1 mm prior to break-through.
7. For through holes with oblique exit, reduce the feed rate v_f to 40% approx. 1 mm prior to break-through.
8. After reaching hole depth stop machine spindle and coolant supply, withdrawal in top gear.

Ratio end mill type RF 100 U, Guhring no. 3736

Thanks to its unequal helix angle, Guhring's FIRE-coated Ratio end mill RF 100 U offers highest feed rates and tool life for finishing and roughing operations in steel and cast materials as well as Ti- and Ni-alloys. Further information about the range can be found in Guhring's current main catalogue.

Ratio drill RT 100 U, Guhring no. 2477

Ratio drill RT 100 F, Guhring no. 1660

Thanks to their special cutting edge geometry, Guhring's Ratio drills excel with very good self-centering characteristics and alignment accurate holes. Type U is especially suitable for the machining of steel and high-alloyed AlSi-alloys, type F for high-alloyed, stainless, acid- and heat-resistant steels, Al and Al-alloys, Mg and Mg-alloys as well as Ti and Ti-alloys.

All deep hole drills must have support for the pilot hole. Deep hole drills must never operate at full speed without support in the machine shop.

RT 100 T – special tools for MQL machining

Special shank end: RT 100 T for MQL machining

RT 100 T is available as a special tool with the shank end optimised for MQL machining.

Because an extremely low volume of coolant is applied with minimal quantity lubrication, the delivery of these low coolant quantities to the effective area is of utmost importance. The Guhring developed conical shank end optimally satisfies the relevant MQL conditions: It prevents lubricant build-up or dead pockets and offers simple operation and cost-efficient production.

In combination with Guhring hydraulic or shrink fit chucks and the Guhring MQL delivery set, it offers the optimum and cost-efficient solution for MQL machining producing the highest hole quality and extremely long tool life.

MQL machining opens up a considerable saving potential

A look at the total manufacturing cost shows that conventional cooling is a considerable percentage of it. It doesn't only include the cost of the cooling lubricant itself, but also cleaning the workpiece and systems as well as the disposal of the cooling lubricant. The application of MQL can clearly reduce this part of the cost. Guhring MQL tools offer the prerequisites for a changeover. The RT 100 T with MQL suitable shank end is, for example, optimally suitable for wet machining as well as MQL.

Therefore, changing over your production does not require new tools! In addition, the MQL suitable shank end is designed for 1- as well as 2-channel MQL systems. You do not have to fear any restrictions when applying Guhring MQL tools.

Shank end suitable for minimal quantity lubrication without build-up or dead pockets of coolant.

Minimal dead area

Length adjustment screw

MQL suitable shank end

The Guhring MQL system
A MQL optimised drilling tool with Guhring's MQL shank end is located in a hydraulic expansion chuck. The delivery of the coolant is realised by a MQL length adjustment screw with sealing lip.

Guhring has developed the spiral-flute deep hole drill RT 100 T ALU especially for the production of deep holes in aluminium materials. The drill is available as a special tool with immediate effect.

In addition to the correct choice of carbide suitable for the machining of aluminium, Guhring has paid special attention to the cutting edge geometry and the flute form when developing the RT 100 T ALU. They offer the following special features:

Spiral flutes with 15° rake angle and improved surface quality

The flute design with a rake angle of 15° ensures a considerably shorter chip travel. In addition, the high surface quality of the flute offers the chips low friction resistance. The RT 100 T ALU evacuates the optimally formed chips efficiently from deep holes without problem.

Application example cylinderhead

A typical field of application for aluminium materials is the automotive industry and especially engine manufacture. When machining a cylinderhead the spiral-flute deep hole drill RT 100 T ALU's level of performance is impressive:

- drilling the main oil gallery
- Ø 6.95 mm, drilling depth 2 x 210 mm
- drilling from both sides
- $v_c = 110$ m/min.
- $V_f = 1500$ mm/min.
- $p = 50$ bar (soluble oil)
- tool life: 500 m

Optimised cutting edge geometry for the machining of aluminium

The cutting edge geometry of the spiral-flute deep hole drill RT 100 T ALU is optimised to produce chips that can be evacuated from deep holes as easily as possible.

The special design of cutting edge geometry...

... provides optimally formed chips...

... and quick chip evacuation.

The procedure for machining aluminium

To achieve optimal machining results in the production of deep holes with the RT 100 T ALU particularly when piloting on radii and/or uneven surface, we recommend the following machining steps:

1. Milling of flat, i. e. with Guhring Ratio end mill RF 100 U incl. centre cutting. The flat must be at right angles to the entry of the drilling operation.
2. Producing a cylindrical pilot hole (tolerance F9) with a minimum drilling depth of 1xD (up to 3xD). We recommend our Ratio drill RT 100 U. Thanks to its point angle of 140° and its Ø-tolerance m7 it is ideally suited for this machining step.
3. Entering the spiral-flute deep hole drill RT 100 T ALU in the pilot hole with a speed of appr. 300 rev./min and a feed rate of appr. 500 mm/min.
4. Setting the cooling lubricant pressure and speed.
5. Continuous drilling to full drilling depth without pecking cycle.
6. For through holes with oblique exit reduce the feed rate v_f appr. 1 mm prior to break-through by 40% .
7. Upon reaching the drilling depth switch off speed and cooling lubricant, withdraw with rapid feed rate.

All deep hole drills must be guided during pilot drilling. Deep hole drills must never operate at full speed unsupported.

☐ Inquiry

☐ Order

☐ Repeat order. no. of initial order

Deep hole gun drill:

☐ RT 100 T

Required no. of pieces: Tool _____ pieces

* Ø 3.0 - 20.0 mm
Drilling depth max. 40 x D
Total length max. 400 mm

Attention: not applicable without starting bushing!

Drawing of lay-out

required in special cases only

Shank:

☐ HA (recommended)

☐ _____

Workpiece:

Drilling depth: _____ **Hole tolerance:** _____ **Material/designation:** _____

Surface finish: _____
